Science-to-Story Translator

Keep the evidence. Change the route into it.

Science-to-Story Translator: a communication planning aid for turning technical source material into audience-aware draft messages.

Includes: framework reference · guidance by Intended audience · printable worksheet

Science-to-Story Translator: reference

SCIENCE COMMUNICATION PROTOTYPE

Turn technical source material into audience-aware communication drafts without losing the facts, caveats or limits that make the work trustworthy. Use the output as a structured first draft, then complete expert and editorial review before publishing.

Human review is required. This tool does not verify science, assess evidence quality, identify missing context, or approve claims. It only structures the facts, caveats and links that you provide into communication-ready draft material.

Brief summary

Build awareness

Clear and calm

READING LEVEL

General public

One-line value proposition

Plain-English summary

Three messaging pillars

- What the work looks at: The study uses satellite-derived land surface temperature data.
- What needs care: Lower tree canopy and more impervious surfaces are associated with higher daytime surface temperatures. However, the study measures surface temperature, not indoor temperature.

What this does not prove

Interpret with care

This material does not prove that the study measures surface temperature, not indoor temperature, it does not measure individual exposure, health outcomes or future climate impacts, and further local validation and community input are needed before prioritising interventions. It should not be presented as a complete account of the evidence, a causal conclusion, individual advice, or a substitute for the full methodology and qualified review.

Human-review checklist

- ! Confirm every factual statement against the approved source material and latest project information.
- ! Check that required caveats remain visible, intelligible and proportionate for the chosen audience.
- ! Ask an appropriate scientific or technical reviewer to approve terminology, interpretation and causal language.
- ! Check links, data access, permissions, image rights, names, affiliations and contact details.
- ! Confirm the call to action is ethical, accessible and appropriate to the audience and research context.
- ! Read the final version aloud for clear, measured language at a general public reading level.

Review the source, all retained facts, caveats, figures, terminology, audience implications, links, permissions and calls to action. Do not publish the draft as verified scientific advice, policy guidance or evidence of causation unless a qualified reviewer has confirmed it.

Guidance by Intended audience

Public

Draft language for public audiences, written in a clear and calm tone and requiring expert review.

Urban heat and neighbourhood design offers why this matters in everyday places and decisions, using verified project information to help people understand what the work can—and cannot—say.

New work is helping build a clearer picture of urban heat and neighbourhood design. This project examines how land cover, building density and tree canopy influence summer surface temperatures across neighbourhoods in Leicester. The key point is that the study uses satellite-derived land surface temperature data.

Policy or public sector

Draft language for policy or public sector audiences, written in a clear and calm tone and requiring expert review.

Policy or public sector

Urban heat and neighbourhood design offers what the evidence can inform, alongside its limits, using verified project information to help people understand what the work can—and cannot—say.

New analysis provides evidence that may help inform urban heat and neighbourhood design. This project examines how land cover, building density and tree canopy influence summer surface temperatures across neighbourhoods in Leicester. The key point is that the study uses satellite-derived land surface temperature data.

Funder or partner

Draft language for funder or partner audiences, written in a clear and calm tone and requiring expert review.

Funder or partner

Urban heat and neighbourhood design offers the public value, progress and next-stage opportunity, using verified project information to help people understand what the work can—and cannot—say.

This work demonstrates an evidence-led approach to urban heat and neighbourhood design. This project examines how land cover, building density and tree canopy influence summer surface temperatures across neighbourhoods in Leicester. The key point is that the study uses satellite-derived land surface temperature data.

Customer or client

Draft language for customer or client audiences, written in a clear and calm tone and requiring expert review.

Customer or client

Urban heat and neighbourhood design offers the practical problem the work can help clarify, using verified project information to help people understand what the work can—and cannot—say.

This work shows how better evidence can support urban heat and neighbourhood design. This project examines how land cover, building density and tree canopy influence summer surface temperatures across neighbourhoods in Leicester. The key point is that the study uses satellite-derived land surface temperature data.

Journalist or media contact

Draft language for journalist or media contact audiences, written in a clear and calm tone and requiring expert review.

Journalist or media contact

Urban heat and neighbourhood design offers the timely finding, context and what it does not establish, using verified project information to help people understand what the work can—and cannot—say.

Researchers are examining urban heat and neighbourhood design. This project examines how land cover, building density and tree canopy influence summer surface temperatures across neighbourhoods in Leicester. The key point is that the study uses satellite-derived land surface temperature data.

Technical peer

Draft language for technical peer audiences, written in a clear and calm tone and requiring expert review.

Urban heat and neighbourhood design offers the method, scope, assumptions and contribution, using verified project information to help people understand what the work can—and cannot—say.

This work investigates urban heat and neighbourhood design. This project examines how land cover, building density and tree canopy influence summer surface temperatures across neighbourhoods in Leicester. The key point is that the study uses satellite-derived land surface temperature data.

Project, study or initiative name

For example: Urban heat and neighbourhood design

Technical source text or abstract

Use only text that has already been checked by the relevant researcher, team or source owner.

Intended audience

- ☐ Public ☐ Policy or public sector ☐ Funder or partner ☐ Customer or client ☐ Journalist or media contact
☐ Technical peer

Communication objective

- ☐ Build awareness ☐ Encourage sign-up ☐ Encourage download ☐ Drive event registration
☐ Start a partnership conversation

Tone

- ☐ Clear and calm ☐ Practical and direct ☐ Curious and inviting ☐ Formal and concise
☐ Purposeful, not alarmist

Reading level

- ☐ General public ☐ Interested non-specialist ☐ Professional audience ☐ Technical specialist

Required facts or claims to retain

These are treated as protected facts in the generated drafts. Verify wording before use.

Required caveats and limitations

Add one caveat or limitation per line.

Required links or sources

Add one link or source label per line.

Planning aid, not advice. Test assumptions with evidence and consider privacy, accessibility, fairness and sustainability before acting.
